

Drug-free IVA as an infertility treatment for aging poor responders
Kazuhiro Kawamura, Japan

In this presentation, I will update clinical outcome of IVA so far. Furthermore, I will introduce the Drug-free IVA conducting Hippo signal disruption only as a new infertility treatment for patients with ovarian dysfunction. Although these patients become poor responders due to limited number of antral follicles to respond FSH stimulation, they still have secondary follicles. Because secondary follicles could stimulate to grow by disruption of Hippo signaling, this method allowed increasing the number of antral follicles, leading to the increase in the number of retrieved oocytes after ovarian stimulation.
